

Current update about our working progress:

To detect and get license plate from the image of vehicle we have done the following work:

- 1) converting the image into BGR color format
- 2) Detecting the edges in the image
- 3) Identifying the license plate section by using 'imutils' python library, and crop the section on the image
- 4) And finally getting the license plate image

We are now working on getting letter from License plate image and calculating the speed of vehicle.
